Faizuddin Mohammed

Buffalo, NY | faizuddin4444@gmail.com | linkedin.com/in/faizuddinmohammed44 | github.com/itachi4

Summary

AI software developer with a focus on cybersecurity, building and running HIPAA-regulated healthcare software end to end. Shipped an AI voice triage platform that handles 10,000-15,000 patient calls a month across 14 clinics, plus a clinical dictation tool and a multi-tenant payments platform with signed approvals and tamper-evident audit logs. Earlier, built banking systems at Infosys for 250,000+ account holders.

Technical Skills

Languages	Python, Java, TypeScript, JavaScript, SQL, Bash
Security and Healthcare	HIPAA safeguards and BAAs, HL7/FHIR, least-privilege IAM, RBAC, KMS encryption, audit logging
Cloud and DevOps	AWS (Bedrock, ECS, S3, Lambda, KMS, IAM Identity Center), Terraform, Docker, GitHub Actions, Jenkins
Backend	Node.js, Express, Spring Boot, Spring Security, FastAPI, WebSockets
Frontend and Desktop	Angular, React, Electron, PyQt/Win32, RxJS, NgRx
Data	PostgreSQL (row-level security), Redis, SQLite, MongoDB
AI and Voice	Bedrock Custom Model Import and Guardrails, Vapi, Twilio Media Streams, streaming TTS, LLM post-processing

Experience

AI Software Developer, MYB Inc., Buffalo, NY

March 2025 - Present

- Run three production platforms (CareRelay, BizInCheck, SoundEasy) used by 14 clinics and 5 client companies. Stack: Node.js and FastAPI services, Angular and Electron clients, Terraform and GitHub Actions for infrastructure and deploys.
- Replaced ad hoc AWS access with a multi-account setup on AWS Organizations and IAM Identity Center. Access requests now take under 15 minutes instead of 3 days, and long-lived shared credentials are retired.

CareRelay: AI voice patient triage (GLM-4 on Bedrock, Vapi, Twilio Media Streams, HL7/FHIR, Terraform)

- Takes 10,000-15,000 patient calls a month across 14 clinics and cut front-desk triage workload by 75%. The voice pipeline pairs Vapi and Twilio WebSockets with a GLM-4 model deployed on Bedrock through Custom Model Import.
- Built HIPAA safeguards into the design: Bedrock Guardrails and KMS encryption across Terraform-managed accounts. Urgent calls escalate automatically, including ambulance dispatch, and staff are alerted to review each escalation. No reported data violations to date.
- Nurse charting latency fell 90%. Call audio becomes structured HL7/FHIR messages, sent by encrypted webhook straight into MedEnt EHR queues.

BizInCheck: multi-company payments and remote cheque platform (Electron, Angular 17, Node.js, PostgreSQL with RLS, Docker)

- Cut cheque signing from 3-5 days to under 5 minutes and saved about $24,000 a year in courier costs across 5 companies. An Electron printing client works with a mobile web portal for remote approval, and each approval is digitally signed.
- Dropped pre-printed cheque stock on 20+ bank accounts with a MICR E-13B canvas rendering engine that prints on blank stock. Moved to PostgreSQL row-level security to keep each company's data separate, now at 10,000+ transactions a month.

- Hash-chained, append-only audit logs make tampering evident. Sequential cheque validation and duplicate payment detection cover more than $5M in volume.

SoundEasy: clinical speech-to-text dictation (Python, PyQt/Win32, LLM formatting, MedEnt EHR)

- Replaced Dragon NaturallySpeaking for 15-30 providers, saving an estimated $18,000-$25,000 a year in licensing. The Python desktop client runs under 100MB of RAM, streams audio at 500ms-1s latency, and retains no audio, which limits PHI exposure.
- Providers save 30-45 minutes of charting a day. Text lands directly in active MedEnt fields through Win32 virtual keystrokes, and an LLM pass cleans up medical grammar and dosages.

Software Development Engineer, Infosys, Hyderabad, India

May 2021 - August 2022

- Built retail banking interfaces in React and Angular for 250,000+ account holders, with sub-second page loads. NgRx and RxJS kept account data in sync in real time.
- Delivered Java and Spring Boot microservices that handle 75,000+ transaction requests a day at under 300ms p95 latency, using RESTful APIs, connection pooling, and tuned PostgreSQL queries.
- Added a Redis cache for account ledgers and transaction lookups. API response times improved 45%, database load dropped 60%, and peak CPU fell from 85% to 35%.
- Secured transaction endpoints with Spring Security RBAC and moved deployments to Docker and Jenkins on AWS EC2. Lead time dropped from 4 hours to under 30 minutes at 99.95% uptime.

Software Engineering Intern, Cleartrip, Bangalore, India

January 2018 - March 2019

- Built Java and Spring Boot booking APIs on the payments path and automated subscription billing retries, which cut transaction drop-offs by 28%. Added webhook notifications that sped up booking confirmations by 35%.

Education

Applied PhD in AI Security (in progress), New Jersey Institute of Technology (NJIT)
via University of the Cumberlands

MS in Computer Science, University at Buffalo, SUNY, Buffalo, NY, December 2023

B.Tech in Computer Science and Engineering, CVR College of Engineering (JNTU), Hyderabad, India, May 2021

Certifications

AWS Certified Solutions Architect - Associate. CompTIA Security+ (in progress).
